SPEAKER 1: What do you think needs to be done to enhance understanding of information assurance?

SUSANNA LIM: I believe we should try and take a look at information that's actually arising from a business issue. That's one. Second, from an IT risk, it should be part under a holistic enterprise risk management, and from a business angle to see the posture of that organisation. If they are more digitised in the way they do things, then you might actually have an IT component as well.

But if it's still probably more manual, then it should be a process issue. And as we sort of look at-- now more organisations are going into the digitalization of things. Then the posture needs to be revisited, and you then need to think about how you're going to identify and then protect some of these areas.

And the other key things that they need to think about, besides identification is, if there is any particular issues that's happening. What's your resiliency? Second, how do you then quickly detect and remediate it. I think this is where the emphasis should be brought in and then talking about the process and the resiliency. And something in EY we talked about is-- I call it the CBRP, which is, what is your cyber response plan? Because we know that these attacks from the internet or attacks from cyber, it's just a matter of time when it will come. So you better have a response plan, similar to our health.
