Information Assurance

Expert Insights – Investment in cyber security initiatives

Yuen, J (2018). *Investment in cyber security initiatives* [Video file]. University of Melbourne. Retrieved from: <https://gomelb.unimelb.edu.au>

SPEAKER 1: What sort of IT investments are CIOs engaging in?

JASON YUEN: Well, I think one of the key areas of course is security. And what we've seen of course with security being one of the top agendas in import, in Malaysia, in Asia, as well as around the world. We've seen that some of the key investments that are being taken include things like how you're protecting data. So data loss prevention as well as protection around data and data security is one of the key areas.

Second area-- I think there's a lot of investment today around security incident monitoring as well as response. Because of our annual global information security survey, one thing that it has shown is that over the past years, clients have basically focused very much on protection. But there isn't enough focus on the two other parts of security, if you think about it.

So if we think about security, we can't think just about protection. We have to think about protection, monitoring, and really response. And what we've seen is that over the years, everyone has focused very much on protection like locking your doors. But there hasn't been enough focus on monitoring what we actually see in our network, as well as responding to the threats that we see. And those investments have started to catch up, I think in the last two years.

So we've seen more and more clients starting to look at how they're handling security monitoring, how they're going to set up security operations centres really to detect what is happening in your network today, understanding what your people are doing, understanding and trying to get an early warning as far as what security incidents are there. I think those are probably some of the big areas of investment today.
